VERSION	DATE	EDITED BY	CHANGELOG (Brief Description)
1	26/10/22	Miguel A. Sánchez	Document creation

2 DESCRIPTION

2.1 INTRODUCTION (PROBLEM & SOLUTION SUMMARY)

It's necessary create a new LOGIN form into the Company Website.

This new form must ask for:

- Username
- Password

2.2 DETAILED PROBLEM DESCRIPTION

The customer company needs a way in order to login users registered manually into the database. That's to say that it's not necessary to create a new registration form. We only need to create a login form in order to check against current database if the username and password are valid.

In positive case, user will be able to access to the rest of the website platform. In other case, we must return an error message in order to alert the user that the input data is wrong.

The input data must be the username and a hidden password. Both input values must submit through a "send" button.

2.3 DETAILED SOLUTION DESCRIPTION

We will create a new form into the current website, called “LOGIN”.

This new webpage will have the following input values with the following labels:

- **Username:** ieshermanosamoros
- **Password:** ***** (not visible for user)

A button, with “LOGIN” text, to submit.

User steps to login:

- The user will have 5 attempts to login
- He/She will input user and password and click to LOGIN button
- Both parameters will be checked into current database
 - If both are correct
 - User will be able to access to the website
 - Otherwise
 - The login will show the following message:
 - ***Username or password are incorrect***
 - User will have 4 attempts more. In case of finish them, the account will be locked along 10 minutes (this value will be configurable) and it will show the following message:
 - ***Account Locked. Please, try later...***

The new form will be responsive. It will be valid for mobile and tablet screens.

TECHNICAL INFORMATION

We'll create a new HTML file, called "login.html" with the following components.

STRUCTURE LEVEL (HTML file):

- `<h2>` with LOGIN text
- form with `method="POST"` and `action="javascript"` `onsubmit="login()"` → *New Javascript function*

Inside the form tag:

- `input type="text"` with `placeholder="Username"`
- `input type="password"` with `placeholder="Password"`
- `input type="submit"` with `value="LOGIN"`

STYLE LEVEL (inside current STYLES.CSS file):

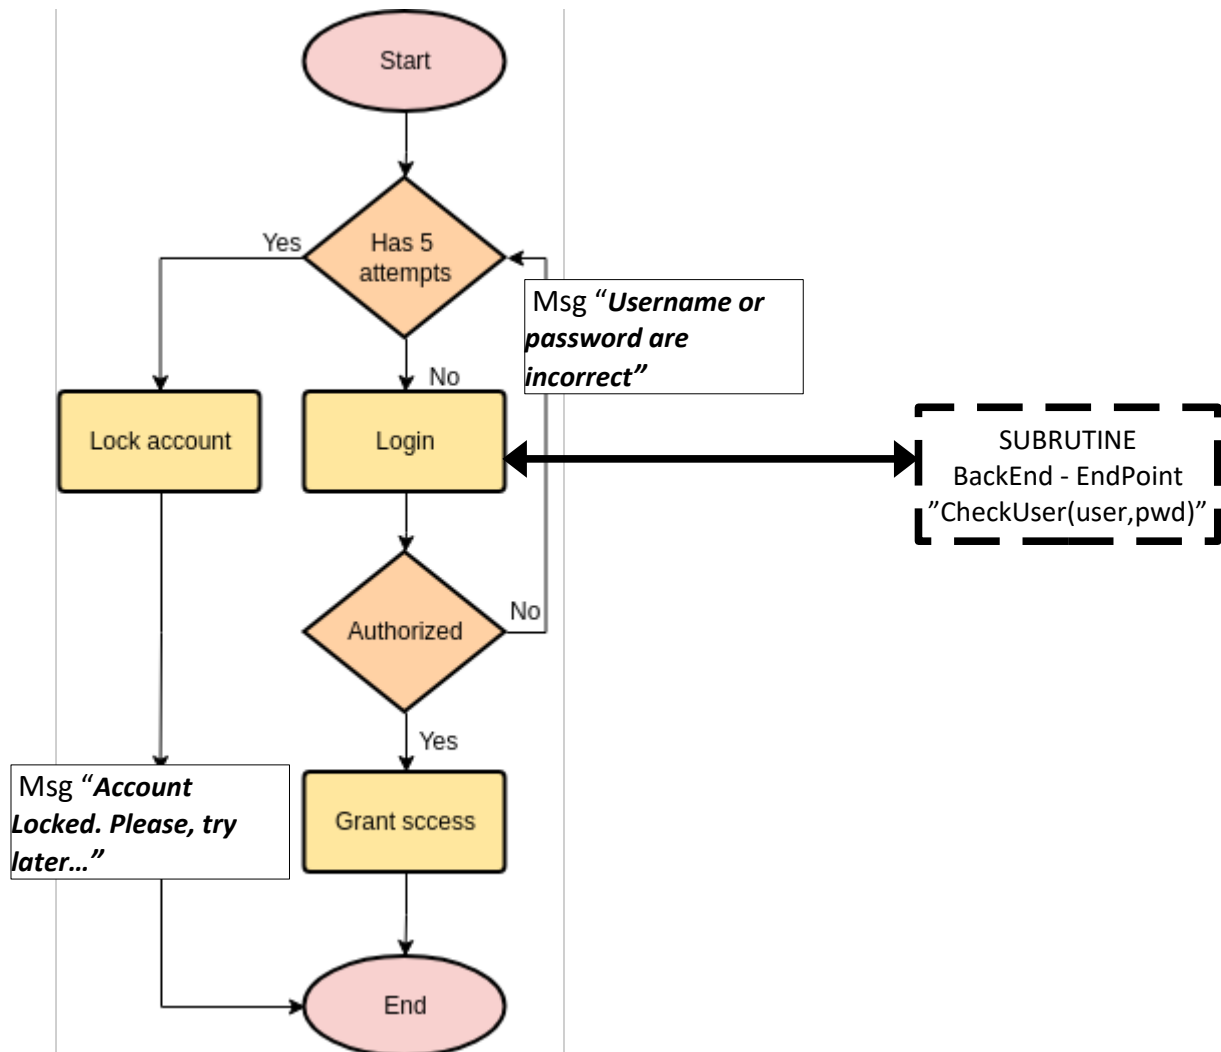

Insert *icons, colors, fonts, media-queries...* following the same styles than MockUps in section 4. Similar to the rest of the current website, the new LOGIN form must be responsive.

BEHAVIOUR LEVEL (inside current APP.JS file):

- Create a new función "**login()**" in app.js file. This new function will take, by POST method, the username and password parameters inside the REQUEST.
- Once take them, this new function will call (by FETCH or AXIOS) to the existing BACKEND EndPoint (API Rest) call "<https://companysite.com/checkuser>".
 - If endpoint returns TRUE, new "login()" function will redirect to "index.html".
 - In other case, it will show an alert with message "**Username or password are incorrect**". Finally, it will increment a global variable with attempts (maximum of 5)
 - If attempts variable arrives to 5, we'll show an alert message "**Account Locked. Please, try later...**" and we'll block session with JS "**setTimeout**" function along 10 minutes (**const** loaded from **web.config** and, therefore, configurable)

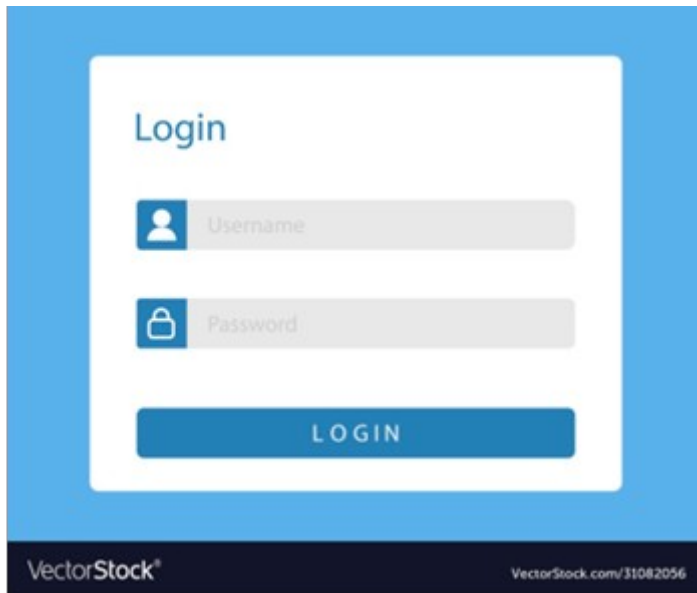

3 MODELING – DIAGRAMS

Mobile preview (responsive)

4 TEST CASES

Extracted from Functional Analysis

Nº	TEST TYPE	TEST DESCRIPTION
1	Login Correct	Checking login with correct user and password from database We must access to the index.html file
2	User Incorrect	Checking login with incorrect user from database. We must see an alert message
3	Pwd Incorrect	Checking login with incorrect password from database We must see an alert message
4	Block user	Try to login 5 times incorrectly in order to check the user block and the correspondent alert message

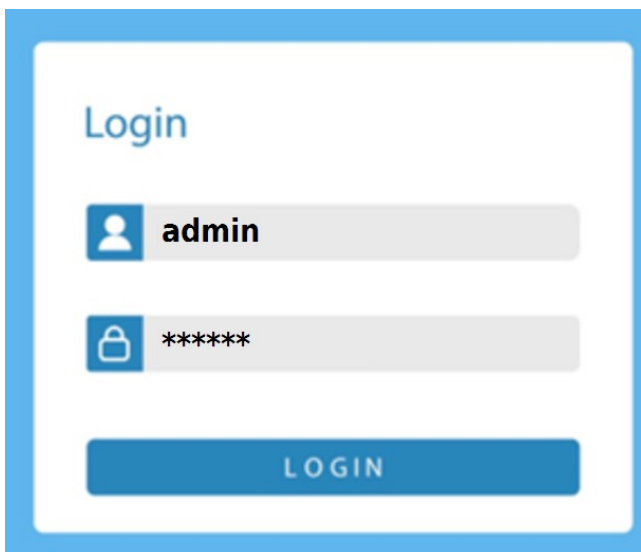

4.1 SCREENSHOTS

4.1.1 TEST 1

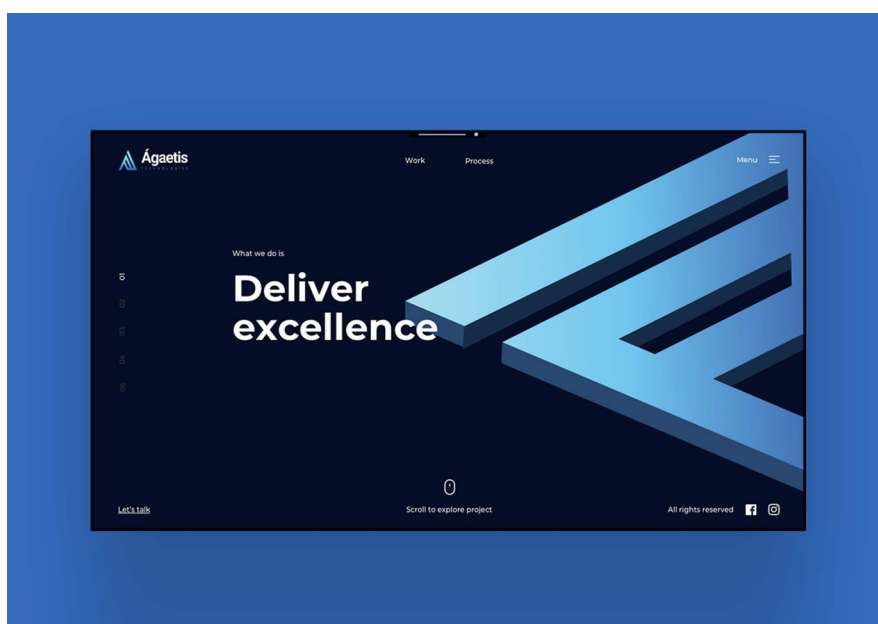

Firstly, I check an existing user and password from database (table "USERS"):

id	user	pwd	name
34	admin	1234	Administrator

We try to login with both user and password:

We have access to the INDEX and main website:

4.1.2 TEST 2

We repeat with invented user:

Login

LOGIN

When we click LOGIN button, we see the following message:

User Name or Password

The account User Name or Password provided is incorrect.

OK Help

4.1.3 TEST 3

[Copy here every screenshot showing and explaining with detail how your test is working]
